# 15 day VarEPS introduced at the ECMWF 28 November 2006

<http://www.ecmwf.int/products/changes/vareps/>

This new system is characterized by a variable resolution during the forecast period (higher in early forecast range) instead of a constant resolution like EPS.

Thus, the forecast range covered by VarEPS was extended to 15 days with TL399L62 (day 0-10)  
and TL255L62 (day 9-15).

see ECMWF Newsletter No. 108 for more detailed information /Buizza et. al., p 14-19/

# Unified VarEPS & Monthly Forecasting System providing reforecast dataset at the ECMWF

## 11 March 2008

<http://www.ecmwf.int/products/changes/vareps-monthly/>

ECMWF combined its **V**ARIABLE **R**ESOLUTION **E**NSAMBLE **P**REDICTION **S**YSTEM (VarEPS) and monthly forecasting into a single system. On Thursday of each week, the 00 UTC VarEPS forecast are extended from 15 to 32 days at a resolution of T255 L62 with ocean coupling introduced from day 10.
