

# **Model uncertainty estimation in global ocean models: Stochastic parametrizations of ocean mixing**

**ECMWF Uncertainty Workshop**

**Stephan Juricke**

**13th April 2016**

**T. Palmer, A. Weisheimer, L. Zanna**

# Overview

1. Introduction
2. Stochastic parametrization
3. Results
4. Conclusions & Outlook

## 1. Introduction: Sub-grid scale variability and model uncertainty

## 2. Stochastic parametrization approach

## 3. Results:

**Uncoupled climate simulations**

**Seasonal forecasts**

## 4. Conclusions & Outlook

# Stochastic parametrization

1. Introduction
2. Stochastic parametrization
3. Results
4. Conclusions & Outlook

## Aim is to:

1. Represent uncertainty in unresolved scales
2. (Re-) Introduce sub-grid scale variability

## General approach:

Perturbations to crucial and imperfectly constrained parameters and/or tendencies in established parametrizations

For example:

$$P(i, j) = (1 + x(i, j)) \cdot P_{ref}$$

Perturbation to parameter  $P$  at timestep  $i$  and grid point  $j$  by random number  $x(i, j)$  to simulate uncertainty and sub-grid scale variations not captured by deterministic parametrizations

# Stochastic parametrization

1. Introduction
2. Stochastic parametrization
3. Results
4. Conclusions & Outlook

## Model configuration:

- 1° Resolution ORCA1L46 grid
- DFS atmospheric forcing for uncoupled simulations

### Parametrized aspects of NEMO

- Horizontal and vertical diffusion through the viscosity and diffusivity coefficients
- Vertical mixing through the vertical viscosity and diffusivity coefficients
- Gent-McWilliams parametrization for tracer diffusion; additional term of tracer advection, along isopycnal surfaces of constant potential density
- Surface, bottom and boundary parametrizations (not discussed here)

Remark: Numerical stability is ensured by increasing viscosity and diffusivity

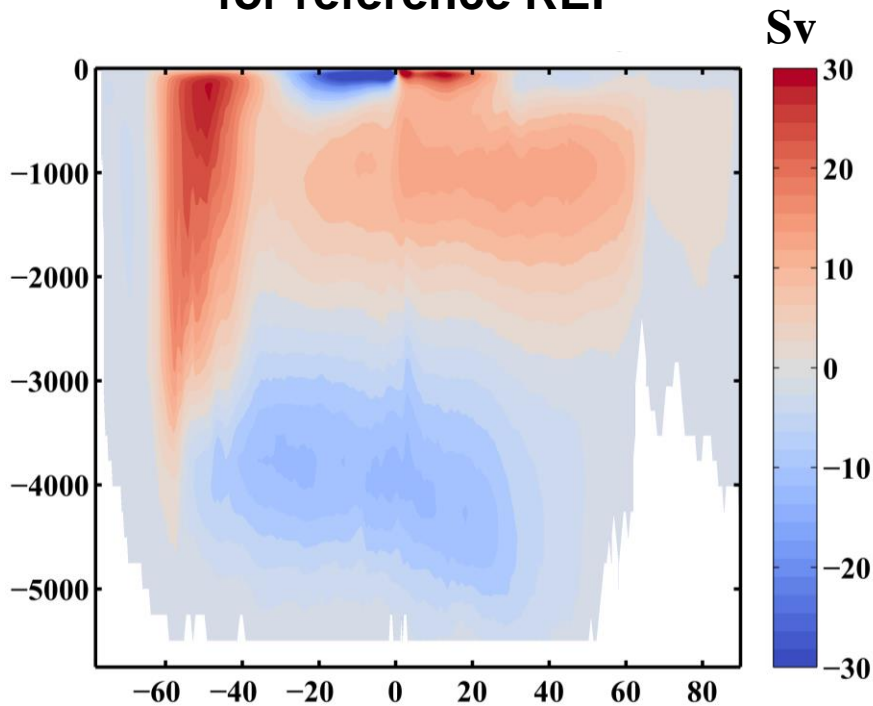

# Stochastic parametrization

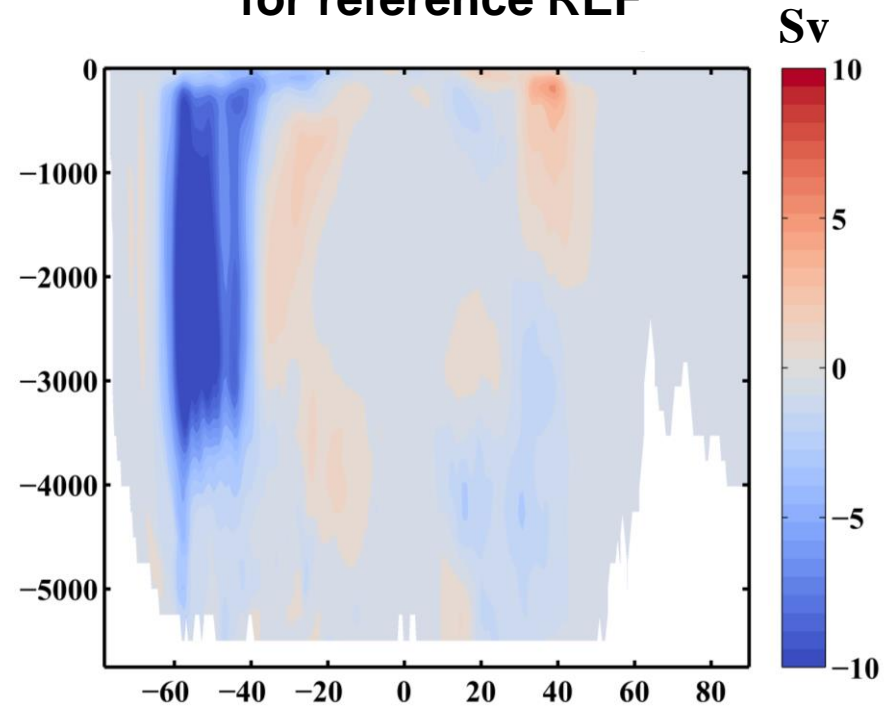

1. Introduction
2. Stochastic parametrization
3. Results
4. Conclusions & Outlook

Global climatology of zonally averaged streamfunction  $\psi_{euler}$  for reference REF

Global climatology of zonally averaged streamfunction  $\psi_{eddy}$  for reference REF

# Stochastic parametrization

1. Introduction
2. Stochastic parametrization
3. Results
4. Conclusions & Outlook

Stochastic perturbations to:

## 1. Gent-McWilliams coefficient

Example: vertical diffusivity in case of unstable stratification  $\frac{\partial T}{\partial t} = \nabla \cdot (\overline{U} + \overline{U}_{eddy}) + D_T + F_T$

3. Shear and buoyancy tendencies in the prognostic equation of temperature with 3D velocity  $U$ , parametrized eddy velocity  $U_{eddy}$ , parametrized turbulent kinetic energy used to parametrize vertical viscosity and diffusivity tendencies  $D_T$  and forcing  $F_T$

Gent-McWilliams eddy induced velocity ( $u$  component):  $\mathbf{u}_g = -\frac{\partial}{\partial z} (A S)$

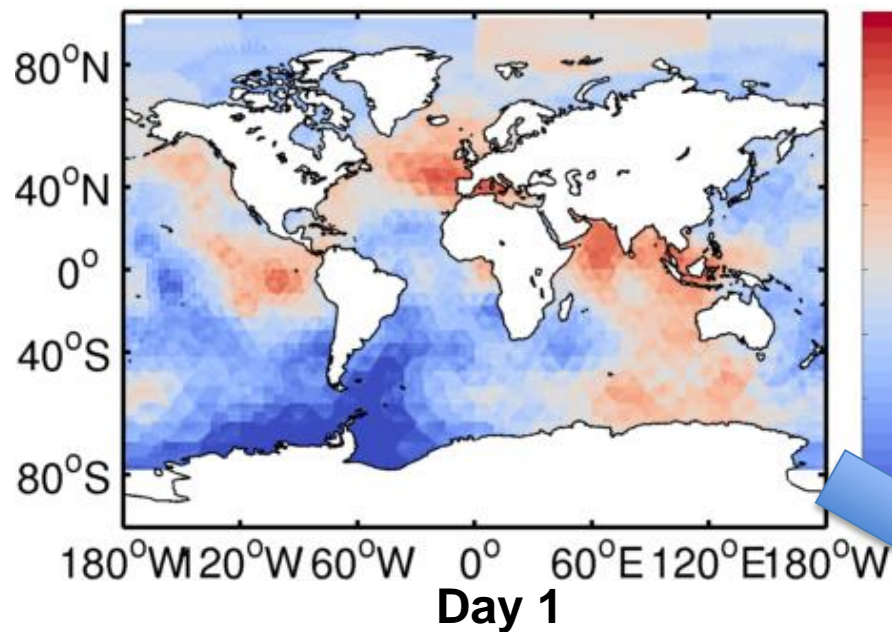

with  $A$  eddy induced velocity coefficient,  $S$  slope of isoneutral surfaces (with regard to geopotential surfaces)  $\rightarrow$  formulation is non-divergent

$$\Rightarrow \mathbf{u}_g = -\frac{\partial}{\partial z} ((1 + r_{GM}) * A S)$$

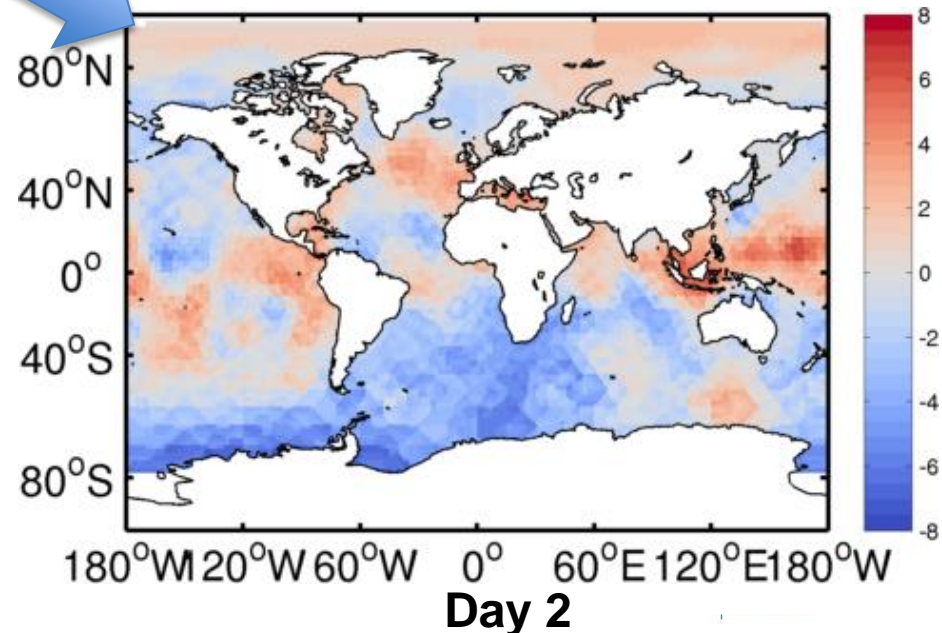

with random number  $r_{GM}$

# Stochastic parametrization

4. Conclusions & Outlook

- **Stochastic mixing schemes introduced to represent sub-grid scale variability and model uncertainty**
- **Improvement in low frequency variability (compared to OBS and reanalysis) of circulation as well as sea surface height (up to 20 to 30% increase in variance)**
- **Potential improvements on representation of low frequency climate modes → Improved mean, variance, and response to forcing without the computational cost of higher resolution**
- **The basic physical principles are not violated (adiabatic, non-divergent GM for example)**
- **Increase in ensemble variance for seasonal forecasts (around 30%)**

- **Further investigate impact on seasonal forecasts**
- **Investigate impact in coupled climate models**
- **Test schemes in higher resolution simulations (potentially develop new schemes)**
- **Estimate parameters for amplitude, temporal and spatial correlations of noise from high resolution simulations and observations**
